1 INTRODUCTION

This health risk assessment (HRA) evaluates the potential health risks associated with construction of Phase 1A through 1C the proposed New Zoo at Elk Grove Project (project) at Assessor's Parcel Numbers (APNs) 132-0320-010, -001 and -002; and 132-2390-006 (intersection of Kammerer Road and Lotz Parkway) in the City of Elk Grove (City), located in Sacramento County. The focus of this HRA is to evaluate the exposure of nearby residential receptors to construction related primarily diesel particulate matter (diesel PM) from diesel-powered equipment and vehicles used during construction and the hauling of materials and emissions of particulate matter (PM₁₀). This assessment was conducted in accordance with the Sacramento Metropolitan Air Quality Management District's (SMAQMD's) California Environmental Quality Act (CEQA) guide *for Dispersion Modeling of Construction-Generated PM10 Emissions* (SMAQMD 2013).

The HRA consists of three parts: a toxic air contaminant (TAC) inventory, air dispersion modeling, and risk calculations. This report discusses these three parts, thresholds of significance used, and the results of the HRA.

2 INVENTORY OF TOXIC AIR CONTAMINANT EMISSIONS

Construction activities for the project would include minimal demolition/excavation and building construction. Construction-related emissions of diesel PM were determined by conducting detailed construction emissions modeling for the project using SMAQMD-recommended California Emissions Estimator Model (CalEEMod), version 2022.1.1.16. CalEEMod default values for equipment parameters (e.g., engine horsepower, number, type per phase) were used. Diesel PM emissions included in the HRA are based on the total PM₁₀ exhaust emissions generated within and near the project boundary.

Construction of Phases 1A, 1B, and 1C are anticipated to begin in mid-2025 and be completed by late 2032. Phase 2 of construction, not evaluated in this HRA, is anticipated to begin in early 2033 and be completed by late 2042. Construction is assumed to occur 10 hours/day, Monday through Saturday.

This HRA includes an evaluation of diesel PM emissions from diesel-powered heavy-duty construction equipment used within the project site, and from diesel trucks used to move materials in and out of the project area. Heavy-duty construction equipment use would occur in areas where grading and new construction would occur within the project boundary. The location of the heavy-duty equipment was based on the locations of each construction phase. Diesel PM emissions generated by heavy duty trucks were modeled along one haul route starting at U.S. Route 99, continuing on Kammerer Road, and terminating at the project site. This approach is conservative because it assumes all traffic, and associated emissions, going to and from the site would occur on a single roadway. If actual traffic is split among other roads, resultant emissions would be lower than modeled.

Emissions estimates from construction equipment and truck trips are shown in Attachment A.

3 AIR DISPERSION MODELING

3.1 APPROACH

To determine health risk and pollutant concentrations at specific locations (i.e., receptors), first, air dispersion modeling was conducted using site-specific parameters (e.g., terrain, meteorological data), and then risk calculations were conducted. Dispersion modeling was conducted using CARB's approved American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee modeling system (AERMOD) Version 11.2.0, with a unit emission rate of 1 gram per second (g/s) for all modeled sources. This approach is used so that resulting ground-level concentrations can be multiplied by actual emission rates for various scenarios (e.g., default model runs, reduced emissions scenario) without running AERMOD multiple times.

Then, using the ground-level concentrations from the AERMOD run at each receptor location in combination with emission estimates for PM₁₀, cancer risk and PM concentration calculations were conducted using cancer potency factors consistent with OEHHA guidance. The air dispersion model included all standard regulatory default options, including the use of rural dispersion parameters and local terrain. Terrain in the project vicinity is generally flat.

Land uses in the surrounding areas include agricultural fields and a neighborhood east of the project site, which results in rural flow patterns that are likely influenced by flat, grassy plains and less pavement and built-up environments. The rural dispersion modeling parameters account for such patterns. The urban heat island effect, which results from surface heating of paved and built-up environment, is likely not prevalent in the project area. AERMOD allows the user to model urban heat island impacts by selecting urban or rural land use option. The project site fits the definition of a rural area; thus, the rural dispersion coefficient option was used in AERMOD to estimate air pollutant concentrations.

3.2 AERMOD MODEL CONFIGURATION

The following input parameters were used in the model run:

- ▶ Projected Coordinate System: Universal Transverse Mercator (UTM) zone 10;
- ▶ Geographic Datum: World Geodetic System (WGS) of 1984;
- ▶ Rural land use based on AERMOD's Land Use Procedure based on the level of development within a 1-kilometer (km) radius of the project site;
- ▶ Period (i.e., annual) averaging of concentrations for construction activity;
- ▶ Unit emission rate of 1 g/s for all sources; and
- ▶ U.S. Geologic Survey North American Datum AD 75 7.5-minute terrain data

3.3 INPUTS AND ASSUMPTIONS

3.3.1 Meteorological Data

Pre-processed meteorological data from 2014-2018 collected at the Sacramento Executive Airport station were obtained from SMAQMD. The model was set to run all five years (i.e., 2014-2018) of the data. The Sacramento Executive Airport station is the nearest to the project site, located along Freeport Boulevard, approximately 11 miles northwest of the project site and the most representative meteorological station for the project site. This station was chosen because it has similar elevation, distance to the coast, and surrounding land uses to the project site. The wind at the Sacramento Executive Airport primarily blows from the south-southwest.

3.3.2 Receptor Grid

A receptor grid was placed around the project site, encompassing receptors within 1,500 feet of the project site with 10 meter (m) spacing for the first 100 meters and 100 meter spacing after that. Discrete receptors were removed from all locations with no sensitive receptors, such as the project site, roadways, and the middle of pastures. All receptors were given a flagpole receptor height of 1.8 m per SMAQMD guidance (2013). All receptor points are shown in Attachment A.

3.3.3 Source Type and Dimensions

For the project site where construction activities would occur, construction emission sources (i.e., the use of heavy-duty equipment on site) were modeled as adjacent volume sources. Each phase was modeled as volume sources to

represent diesel PM exhaust with sides of 40 meters, initial lateral dimensions of 9.3 meters, and initial vertical dimensions of 1 meter, and a release height of 5 m, consistent with SMAQMD guidance (SMAQMD 2013).

Haul routes were modeled using adjacent line volume sources along the paths of travel. The truck line volumes were modeled assuming a release height of 3.4 m, representing exhaust release from a typical truck. Additionally, plume width was 8.0 m and plume height was 6.8 m. The length of haul route was approximately 2332.5 meters (1.45 miles) and extended from the project site, south along Lotz Parkway to Kammerer Road to California Freeway 99.

4 HEALTH RISK CALCULATIONS

4.1 CANCER AND NON-CANCER RISK

To analyze impacts to sensitive receptors, the resulting pollutant concentrations from the AERMOD dispersion analysis were multiplied by the emission rates to obtain risk estimates. Risk calculations were conducted using the following parameters, consistent with OEHHA guidance, shown in Table 1. All risk calculations are included in Attachment A.

Table 1 Risk Parameters for Cancer and Non-Cancer Health Risk Assessment

| Risk Parameters | Residential Receptors |
|------------------------------|---|
| Analysis Type | Cancer Risk and Chronic Risk (Non cancer) |
| Receptor Type | Residential |
| Exposure Duration | 7.5 years (June 2025-December 2032) 0.25 years in 3 rd Tri, 2 years in 0<2, and 5.3 in 2<16 |
| Averaging Time | 70 years |
| FAH ^a | 1.0 for all age bins |
| Breathing Rates ^b | 361 in 3 rd Tri, 1090 in 0<2, and 572 in 2<16 |

^a Since a residence is within the 1 in a million isopleth, FAH is conservatively set to 1.0.

^b Based on Point Estimates of Residential Daily Breathing Rates, Table 5.6, OEHHA 2015, 95th percentile for 3rd trimester and 0<2 bins; 80th percentile thereafter (for residences only)

Notes: FAH = fraction of time at home

Source: Prepared by Ascent Environmental, Inc., in 2023

5 HEALTH RISK CEQA THRESHOLDS OF SIGNIFICANCE

According to SMAQMD, a project’s impact on health risks would be considered significant under the CEQA if the project-related increase in risks would exceed the following thresholds shown in Table 2. Results of this HRA are compared to the SMAQMD-adopted thresholds of significance.

Table 2 Significant Health Risk Levels

| Project-Level | Significance Risk Threshold |
|---|--|
| Individual Project: Construction and/or operations | Compliance with a qualified community risk reduction plan, or ▶ Increased cancer risk of > 10 chances in one million ¹ ▶ Increased noncancer risk of > 1.0 Hazard index |

¹ Maximum Incremental Cancer Risk is the maximum lifetime excess cancer risk estimate (per million) at residential or worker receptor (whichever is greater). The maximum estimated risk generally is possible at only one location. All other locations show lower risks. Source: OEHHA 2015

6 RESULTS

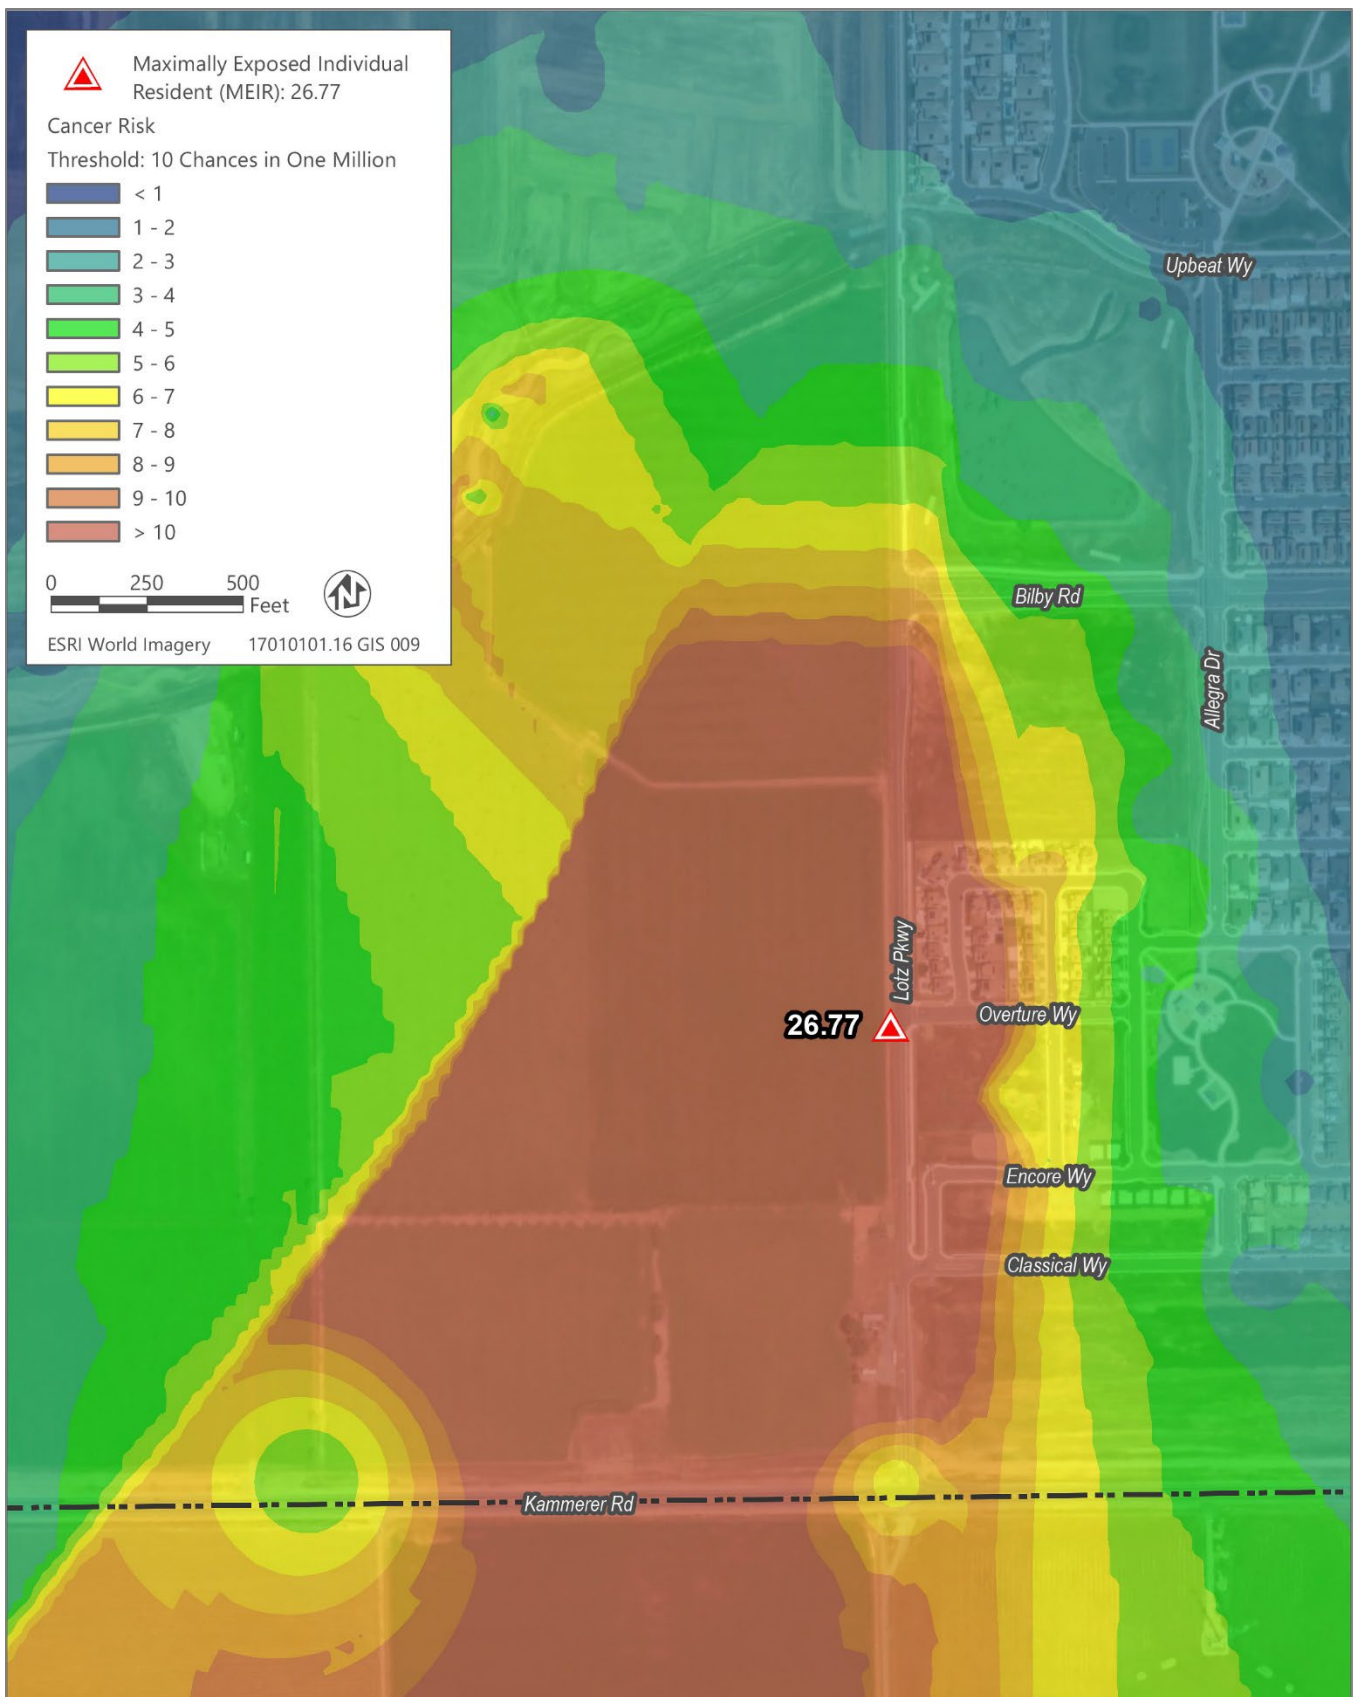

Results of the modeling are discussed below and presented graphically in Figure 1 and Figure 2 for the unmitigated and mitigated analyses, respectfully.

6.1 UNMITIGATED CONSTRUCTION EMISSIONS

Based on the CalEEMod modeling, air dispersion modeling, and risk calculations discussed above, project-generated diesel PM emissions before mitigation are estimated to result in a maximally exposed individual resident (MEIR) for cancer risk of 26.77 chances in one million. Considering SMAQMD threshold of significance of 10 chances in one million for cancer risk, the MEIR exceeds the applicable threshold of 10 chances in one million for cancer risk. This would make the cancer risk impact of construction significant and mitigation would be required to reduce the impact.

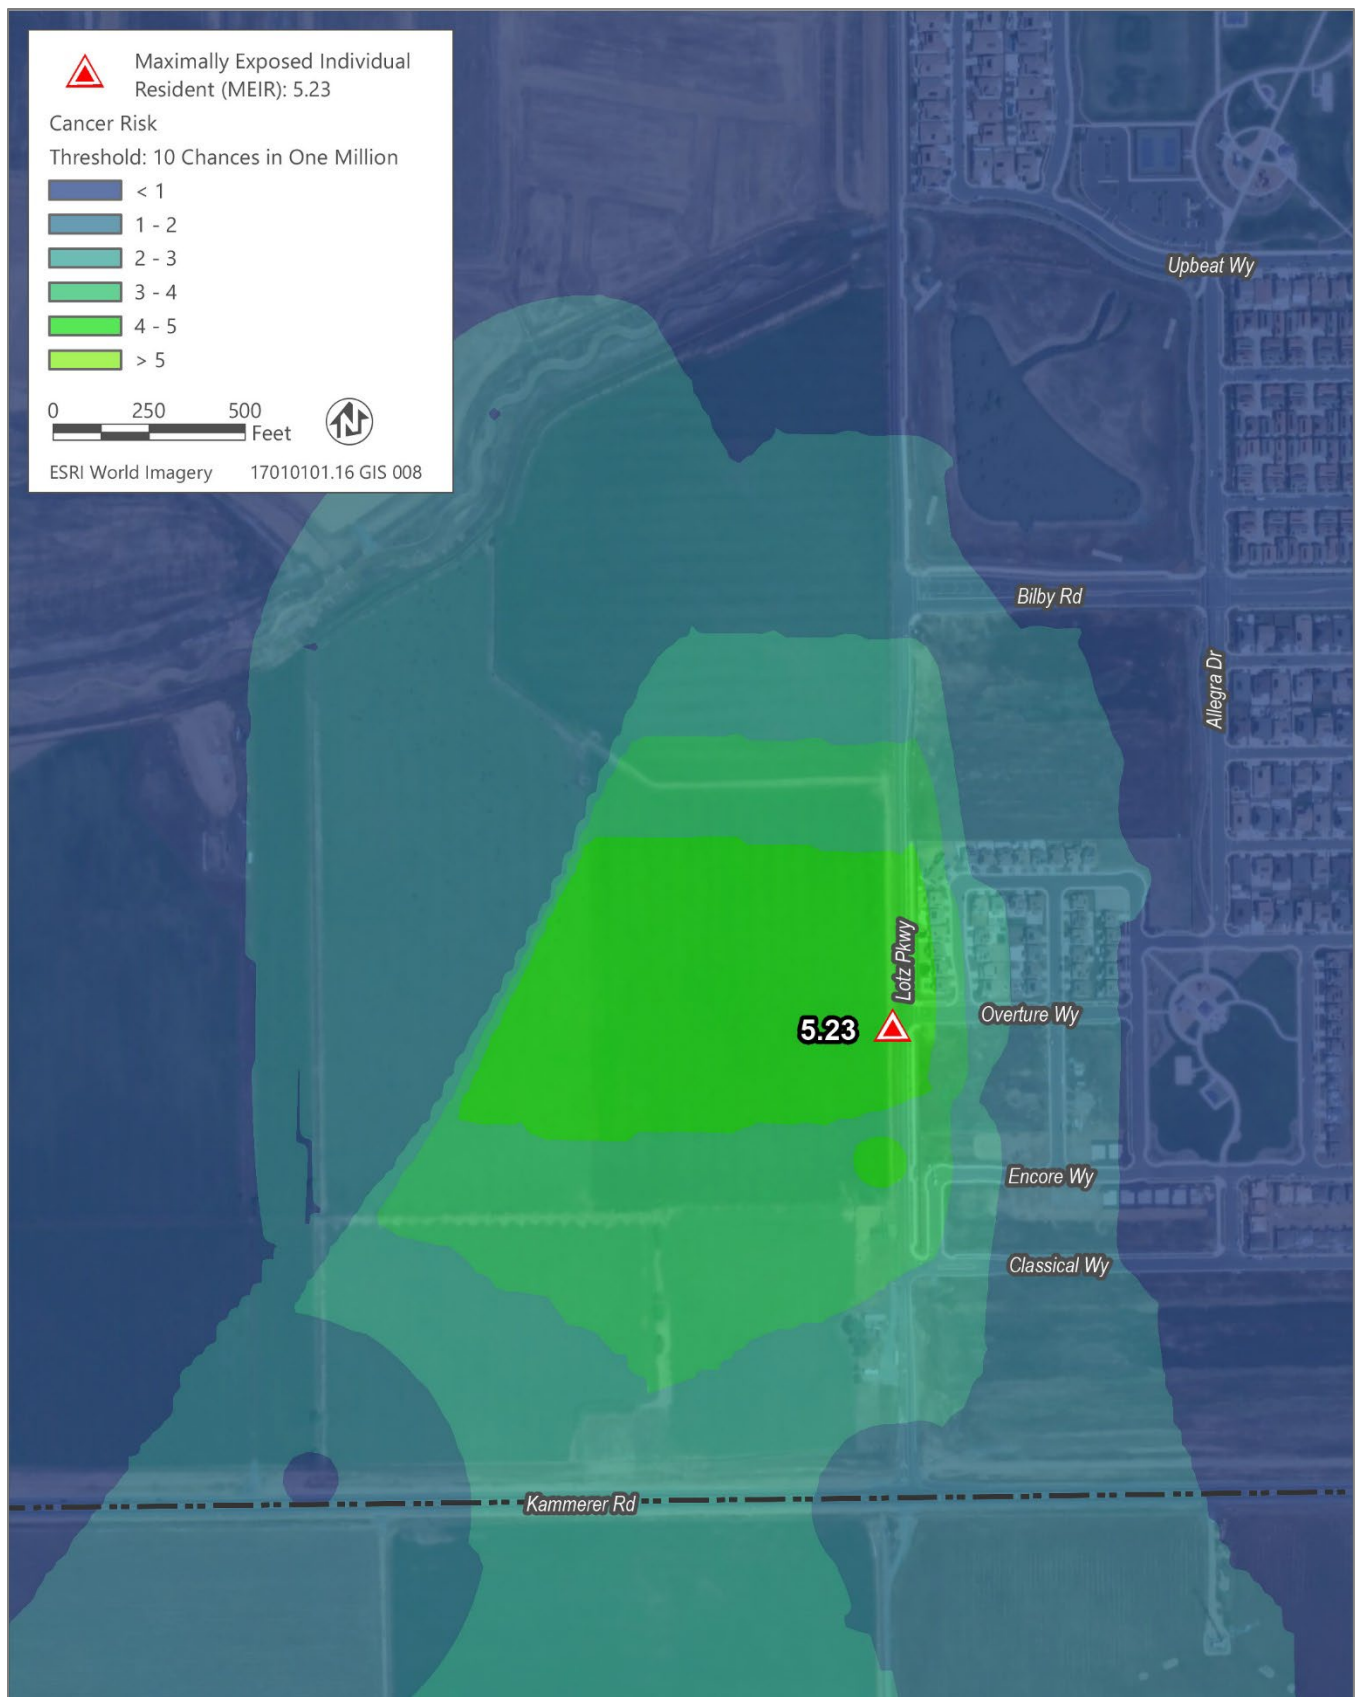

6.2 MITIGATED CONSTRUCTION EMISSIONS

To mitigate this impact, all construction equipment would be required to use Tier 4 (Final) engines. Implementation of Tier 4 equipment on-site would reduce the total diesel PM₁₀ construction emissions by 78.6 percent (996 lbs to 213 lbs) relative to the unmitigated scenario. As a result, project-generated diesel PM emissions would be reduced by 80.5 percent and result in MEIR for cancer risk of 5.23 chances in one million and would not exceed the applicable threshold of 10 chances in one million for cancer risk. Considering that the MEIR represents the greatest risk value modeled, the thresholds would not be exceeded at any nearby offsite receptor.

Figure 1 Unmitigated Cancer Risk Threshold: 10 Chances in One Million

Source: adapted by Ascent in 2023

Figure 2 Mitigated Cancer Risk Threshold: 10 Chances in One Million

6.2.1 Conclusion

Before mitigation, construction of phases 1A-1C would expose nearby receptors to significant cancer risk, over the 10 chances in one million threshold. With mitigating all onsite construction equipment to tier 4 engines, construction-generated TACs would not expose nearby receptors to significant cancer risk (i.e., greater than 10 chances in one million. Construction-related exposure from TACs would be **less than significant after mitigated is incorporated**.

12 years of construction, exposure starts at age 0

Exposure Frequency:

| | |
|-------------------------------------|-----|
| Annual Park Days (days/yr): | 104 |
| Daily Duration at Park (hours/day): | 2 |
| Days/year: | 365 |
| Hours/day: | 24 |

9 0.023744292
0.024657534

1. OEHHA Table 5.8, 95th percentile, moderate activity for 0<2 and 2<16.
2. Based on attending park 2 hours per day, twice per week
3. ASF based on OEHHA Table 8.3
4. Averaging Time always 70 years
5. Conservatively assumed 1.0 for all age bins
6. Conversion factor to convert cancer risk to chances per million
7. DPM CPF from Table 7.1

PARK DOSE: CONC x DBR x A x EF x CF

PARK CANCER RISK: Dose x CPF x ASF x ED/AT x FAH x CCF

9 Exposure Frequency Days for HARP
n/a Adjustment Factor
Reason provided:
0.02 Exposure Frequency comes out to 9 days of exposure. Math = 104/365 * 2/24...2 days/yr at park, 2 hrs/day each time

| Cancer Potency Factor (mg/kg/day) ⁻¹ | CPF ⁷ | 1.1 | 1.1 |

12 years of construction, exposure starts at age 0

Exposure Frequency:

| | |
|-------------------------------------|-----|
| Annual Park Days (days/yr): | 104 |
| Daily Duration at Park (hours/day): | 2 |
| Days/year: | 365 |
| Hours/day: | 24 |

9 0.023744292
0.024657534

1. OEHHA Table 5.8, 95th percentile, moderate activity for 0<2 and 2<16.
2. Based on attending park 2 hours per day, twice per week
3. ASF based on OEHHA Table 8.3
4. Averaging Time always 70 years
5. Conservatively assumed 1.0 for all age bins
6. Conversion factor to convert cancer risk to chances per million
7. DPM CPF from Table 7.1

PARK DOSE: CONC x DBR x A x EF x CF

PARK CANCER RISK: Dose x CPF x ASF x ED/AT x FAH x CCF

9 Exposure Frequency Days for HARP
n/a Adjustment Factor
Reason provided:
0.02 Exposure Frequency comes out to 9 days of exposure. Math = 104/365 * 2/24...2 days/yr at park, 2 hrs/day each time
